

2008 Alfalfa Variety Trial Report

Gary Bates and Joe Beeler, Plant Sciences
The University of Tennessee

The purpose of forage cultivar evaluation is to aid producers in the selection of the best cultivars for their farm. The data in the following tables were conducted using plot design, experimental techniques, and management that were considered best management practices for each crop. These studies were planted in spring, 2008, and were only irrigated to aid in establishment.

Least significant difference (LSD) values at the five percent level are shown at the bottom of each table. Within any table, yields of any two varieties being compared must differ by at least this amount to be considered different in yielding ability. Also, coefficient of variation (CV %) values are shown at the bottom of each table. This value is a measure of the consistency of yields found within each study.

Table 1: Yield of alfalfa varieties during 2008 at the East Tennessee Research and Education Center in Knoxville.
